

prioritized targets n=10,044

transcriptomics 8,260

genetics 3,038

1,254 shared

unvalidated 9,018 (90%)

39 genes in ≥ 2 assays

corroborated 1,026 (10%, ≥ 1 assay)

1 square = ~25 genes

proteomics
716 / 3,150

spatial
112 / 164

snATAC
237 / 507

≥ 2 assays
39

unvalidated
9,018

validated / assayed

convergence vs chance 1 dot = 1 gene

dashed box = 95% chance envelope; a gene past it beats chance

proteome and spatial

19 vs 9.2 expected 2.08x $p=1e-3$ -> beats chance

proteome and snATAC

same 19 genes, 26 expected -> at chance

spatial and snATAC

1 gene, ~0.3 expected -> at chance

all three

0 -> none survive
